

Drawing

Confident use of pencil and pen techniques to create a high level of detail and depth in the work.
A mixture of heavy and more subtle line and tonal shading add to the quality of the work.

Very fine textures are observed and added to the surface of the cells and mushrooms.

Shadows are used to add depth the bacteria work. The student worked closely from secondary microscope images while creating this page.

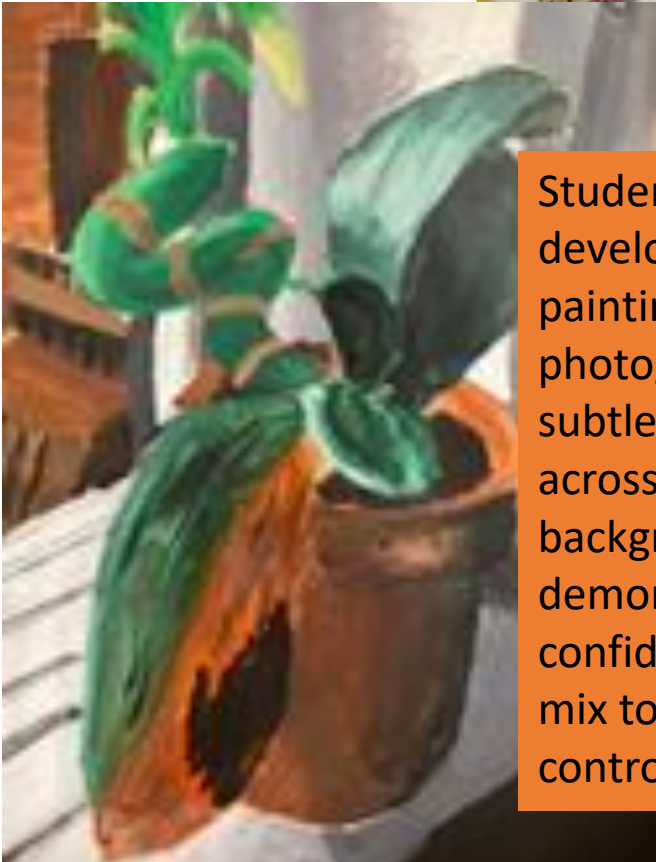

Painting

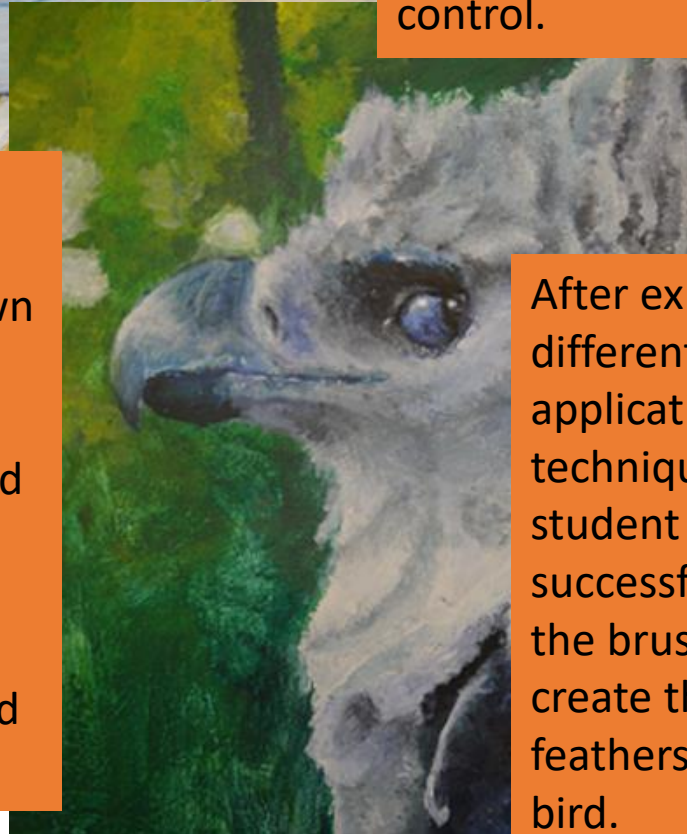

The Student has developed this painting from her chosen artist's style. She has used fine brush work to create fine fish textures.

Very controlled brush control.

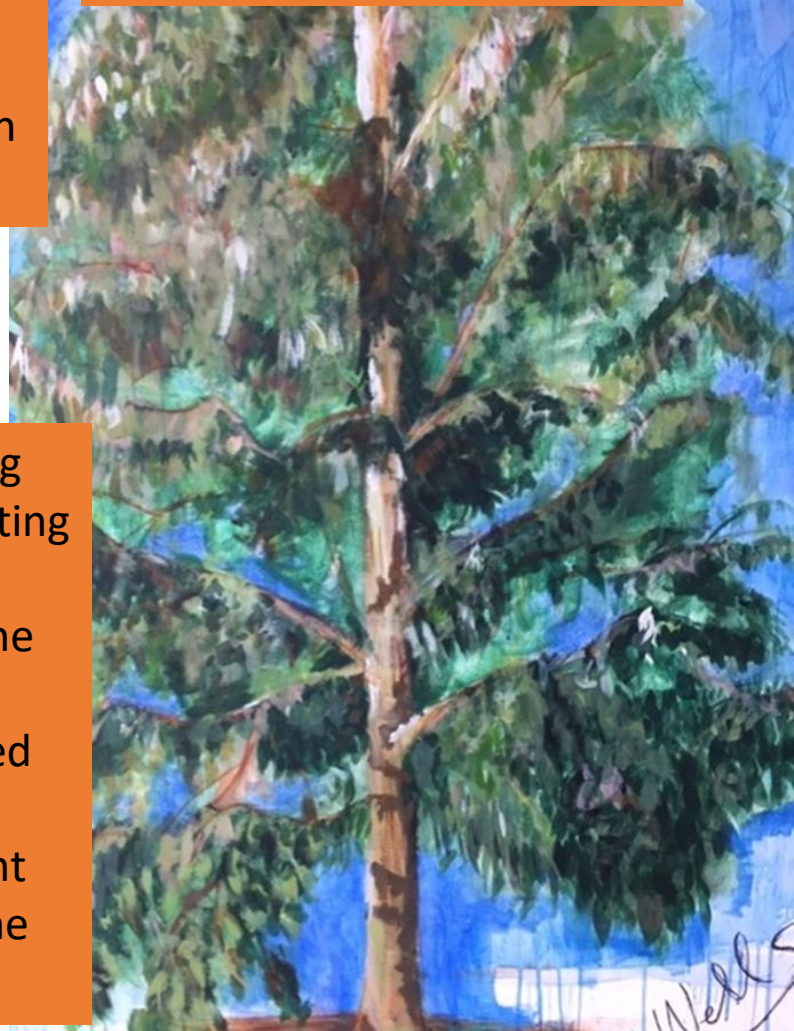

A broad range of tones used in the greenery and subtle changes across the bark.

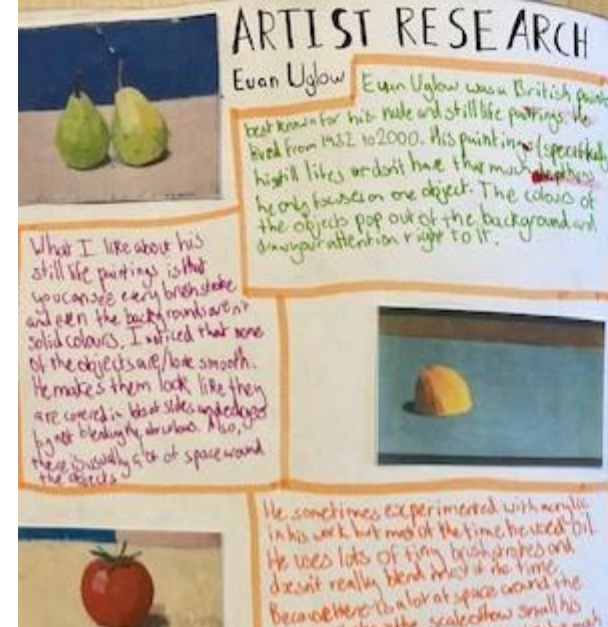

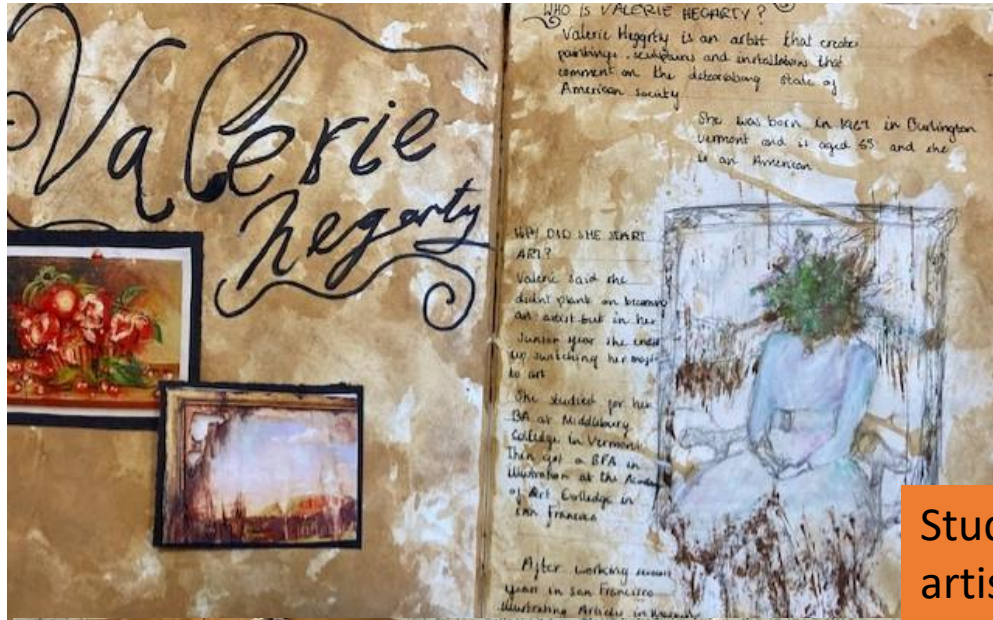

Student has developed this painting from his own photograph. The subtle shift in light across the leaves and background demonstrate his confident ability to mix tonal shades and control the paint.

After exploring different painting application techniques, the student successfully used the brush to create the light feathers on the bird.

Artist Research

Students have imitated their chosen artist's style, selecting similar application techniques, themes and compositions.

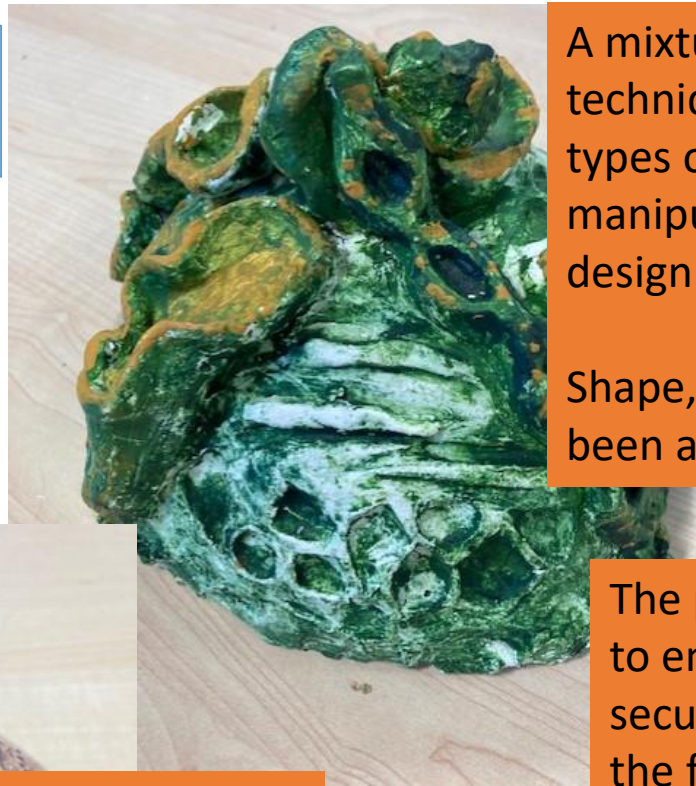

Written analysis also demonstrated the students in depth knowledge of the artist's work.

Key elements of the artist's work is clearly documented in the written and visual communication.

Sculpture

Students have worked closely from cell & bacteria images while forming the shapes.

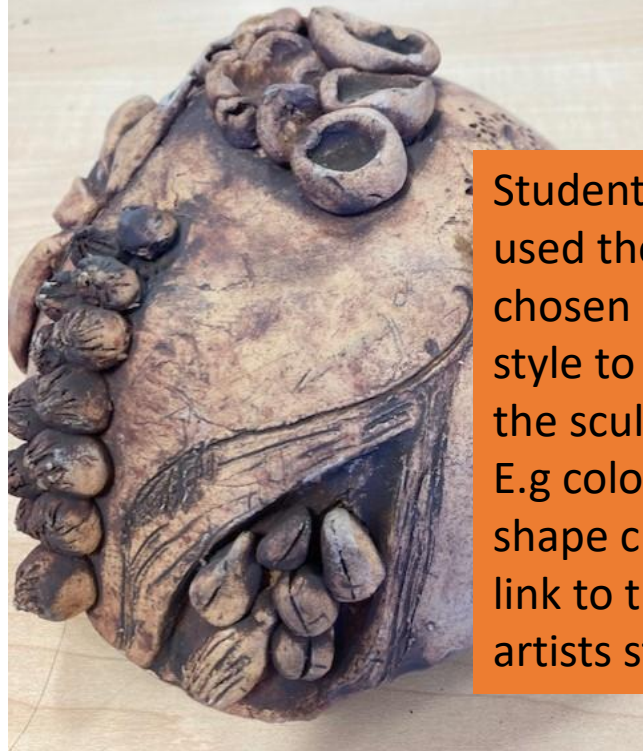

A mixture of applied and incise techniques made using different types of tools. Student have clearly manipulated the clay to suit their design drawings.

Shape, details and textures have been added to each piece.

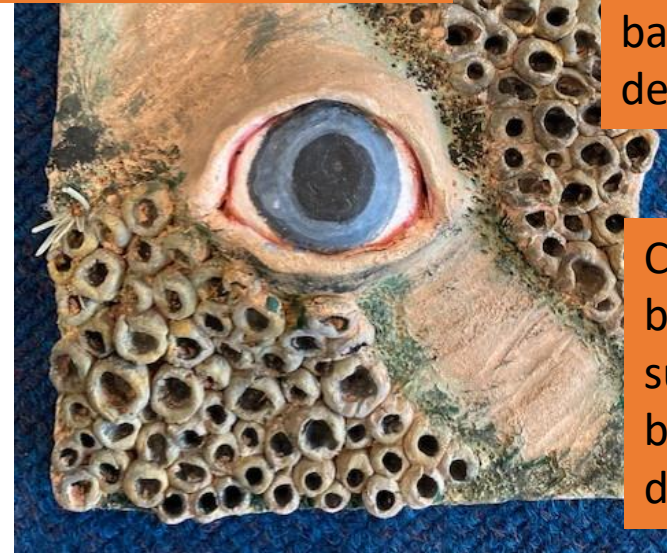

The process has been followed closely to ensure each part of the sculpture is secured in place and can withstand the firing process.

Students have used their chosen artist style to design the sculpture. E.g colour and shape choice all link to the artists studied.

Student manage to create fine bacteria using dental tools

Colour work has been adapted to suit the theme bacteria and decay.
