

YEAR 10 — GEOMETRY...

Working with circles

@whisto_maths

What do I need to be able to do?

By the end of this unit you should be able to:

- Recognise and label parts of a circle
- Calculate fractional parts of a circle
- Calculate the length of an arc
- Calculate the area of a sector
- Understand and use volume of a cone, cylinder and sphere.
- Understand and use surface area of a cone, cylinder and sphere.

Keywords

Circumference: the length around the outside of the circle — the perimeter

Area: the size of the 2D surface

Diameter: the distance from one side of a circle to another through the centre

Radius: the distance from the centre to the circumference of the circle

Tangent: a straight line that touches the circumference of a circle

Chord: a line segment connecting two points on the curve

Frustrum: a pyramid or cone with the top cut off

Hemisphere: half a sphere

Surface area: the total area of the surface of a 3D shape.

Parts of a circle

R

Fractional parts of a circle

A circle is made up of 360°

Formula to remember:
 Area of a circle = πr^2
 Circumference of a circle = πd or $2\pi r$

The fraction of the circle is as $\frac{\theta}{360}$
 θ represents the degrees in the sector

Arc length

Remember an arc is part of the circumference
 Circumference of the whole circle = $\pi d = \pi \times 9 = 9\pi$

Perimeter

Perimeter is the length around the outside of the shape
 This includes the arc length and the radii that enclose the shape

Perimeter = $\frac{\theta}{360} \times \text{circumference} + 2r = 6\pi + 9$

Sector area

Remember a sector is part of a circle
 Area of the whole circle = $\pi r^2 = \pi \times 6^2 = 36\pi$

Volume of a cone and a cylinder

Volume Cylinder = $\pi r^2 h$

Volume Cone = $\frac{1}{3} \pi r^2 h$

A cylinder is a prism — cross section is a circle

A cone is a pyramid with a circular base

Give your answer in terms of π'
 means NOT in terms of pi $= 502.7 \text{ cm}^2$

Look out for trigonometry or Pythagoras theorem — the radius forms the base of a right-angled triangle

Volume of a sphere

Volume Sphere = $\frac{4}{3} \pi r^3$

NOTE: This is now a cubed value

Look out for hemispheres being placed on other 3D shapes, e.g. cones and cylinders

A hemisphere is half the volume of the overall sphere
 $= 36\pi \div 2 = 18\pi$

Surface area of a sphere

Surface area = $4\pi r^2$

A hemisphere has the curved surface AND a flat circular face

$= 100\pi \div 2 = 50\pi$
 $= 50\pi + \pi \times 5^2$
 Hemisphere $= 75\pi$

Surface area of cones and cylinders

Surface area cylinder = $2\pi r^2 + \pi dh$

The area of two circles (top and bottom face) + the area of the curved face

The length of shape B is the circumference of the circles

Curved surface area Cone = $\pi r l$

Look out for the use of Pythagoras to calculate the length l

Total surface area = curved face + circle face (area of base)

Angles and bearings

What do I need to be able to do?

By the end of this unit you should be able to:

- Understand and represent bearings
- Measure and read bearings
- Make scale drawings using bearings
- Calculate bearings using angle rules
- Solve bearings problems using Pythagoras and trigonometry

Keywords

Cardinal directions: the directions of North, South, East, West

Angle: the amount of turn between two lines around their common point

Bearing: the angle in degrees measured clockwise from North

Perpendicular: where two lines meet at 90°

Parallel: straight lines always the same distance apart and never touch. They have the same gradient

Clockwise: moving in the direction of the hands on a clock

Construct: to draw accurately using a compass, protractor and or ruler or straight edge.

Scale: the ratio of the length of a drawing to the length of the real thing

Protractor: an instrument used in measuring or drawing angles.

Measure angles to 180°

R

This is the angle being measured

The base line follows the line segment

Make sure the cross is at the point the two lines meet

Read from 0° on the base line. Remember to use estimation. This is an obtuse angle so between 90° and 180°

Draw angles up to 180°

R

Draw a 35° angle

Make a mark at 35° with a pencil. And join to the angle point (use a ruler)

Make sure the cross is at the end of the line (where you want the angle)

The angle

Angle notation

The letter in the middle is the angle. The arc represents the part of the angle

Angle Notation: three letters **ABC**. This is the angle at $B = 113^\circ$

$\angle ABC$ is also used to represent the angle at B

Understand and represent bearings

- A bearing is always measured from **NORTH**
- It is always given as three figures

The bearing of B from A is calculated by measuring the highlighted angle

The angle indicated starts from the North line at A and joins the path connecting A to B

This angle shows the bearing of B from A

The sentence... "Bearing of ___ from ___" is really important in identifying the bearing being represented

Using **estimation** it is clear this angle is between 090° and 180°

Scale drawings

R

1 : 20

For every 1cm on the model there are 20cm in real life

Remember: Scale drawings **ONLY** change lengths and distances. Angles remain the same

Directions

Clockwise

Anti-Clockwise

Measure and read bearings

The bearing of the cow to the barn

This angle is measured from **NORTH**. It is measured in a clockwise direction. **Estimation** indicates this angle is between 180° and 270° . Use a protractor to measure accurately. Remember: bearings are written as three figures.

The auxiliary line is drawn to help you measure and draw the angle that is measured to represent the bearing

Scale drawings using bearings

Remember — angles **DO NOT** change size in scaled drawings

The bearing measurements do not change from "real life" to images

The units in the ratio scale are the same

The scale may need to be calculated from the image. This represents 30km from P to Q

6cm = 30km
6:3,000,000

Bearings with angle rules

Because two North lines are **PARALLEL**....

They form **corresponding angles** and therefore are the same size

They form **co-interior angles** and add up to 180°

They form **alternate angles** and therefore are the same size

Bearings with right-angled geometry

"Due West" bearing of 270° makes a 90° angle

"Due East" bearing of 090° makes a 90° angle

A plane flies East for 20km then turns South for 15km. Find the bearing of the plane from where it took off.

Use $\tan^{-1}(\frac{15}{20})$ to calculate this angle
